

I am

User

User

I'm trying to

to gain insight into
what people think
when a recognition
error occurs

make digit recognition
to extract and remove
the redundancy from
the data

But

to discover whether a simple
monochrome display of a user's
handwriting prototypes would provide
information which could be used to
improve recognition accuracy

it is quite exhausting
that humans cannot
recognise even their
own written script

Because

the results of the study
suggested that a display of a
handwriting prototypes can
be used by people to improve
recognition accuracy

most of the human's
digit handwriting
looks more similar

Which makes me feel

share ideas and
identify the
problem

to build a new platform
to recognise every
unique handwriting
